

Rotary Damper

FRT-E2/E9 Series

Bi-Directional Uni-Directional
Fixed Type Adjustable type Self-adjusting

RoHS Compliant

●Products specification might be changed without notice.

Specifications

Model	Rated torque
FRT-E2-100G1	$(1 \pm 0.5) \times 10^{-3} \text{ N} \cdot \text{m}$ 10 $\pm$ 5 gf·cm
FRT-E9-100G2	
FRT-E2-200G1	$(2 \pm 0.7) \times 10^{-3} \text{ N} \cdot \text{m}$ 20 $\pm$ 7 gf·cm
FRT-E9-200G2	
FRT-E2-300G1	$(3 \pm 0.8) \times 10^{-3} \text{ N} \cdot \text{m}$ 30 $\pm$ 8 gf·cm
FRT-E9-300G2	
FRT-E2-400G1	$(4 \pm 1) \times 10^{-3} \text{ N} \cdot \text{m}$ 40 $\pm$ 10 gf·cm
FRT-E9-400G2	

- * Max. rotation speed 50rpm
- * Max. cycle rate 10cycle/min
- * Operating temperature 0 ~ 50°C
- * Weight FRT-E2 : with gear : 0.41g
FRT-E9 : with gear : 0.38g
- * Body and cap material Polycarbonate (PC)
- * Rotating shaft material Polyacetal (POM)
- * Gear material Polyacetal (POM)
- * Oil type Silicone oil

Note 1) Rated torque measured at a rotation speed of 20rpm at 23°C
Note 2) Gear model number has G1 and G2 at the end

Note 3) Torque can be customized by changing the oil viscosity (see Customizable Torque Chart on page 178)
Note 4) Model E9 is a customized product with a one-sided mounting

Gear Specifications

Model	G1 (for E2)	G2 (for E9)
Type	Standard spur gear	Standard spur gear
Tooth profile	Involute	
Module	0.6	
Pressure angle	20°	
Number of teeth	10	11
Pitch circle diameter	φ6	φ6.6

Damper Characteristics

1. Speed characteristics

A rotary damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. In addition, please note that the starting torque slightly differs from the rated torque.

2. Temperature characteristics

A rotary damper's torque varies according to the ambient temperature. In addition, as shown in the graph to the right, the torque decreases as the ambient temperature increases, and the torque increases as the ambient temperature decreases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. When the temperature returns to normal, the torque will return to normal as well.

Specifications

Model	Rated torque	Damping direction
FRT-F2-203	2±0.4 N·m (20±4 kgf·cm)	Both directions
FRT-F2-303	3±0.8 N·m (30±8 kgf·cm)	Both directions
FRT-F2-403	4±1 N·m (40±10 kgf·cm)	Both directions
FRN-F2-R203	2±0.4 N·m (20±4 kgf·cm)	Clockwise
FRN-F2-L203		Counter-clockwise

- * Max. rotational speed 50rpm
- * Max. cycle rate 10cycle /min
- * Operating temperature 0 ~50°C
- * Weight FRT-K2 : 115.6g
FRN-K2 : 93.2g
- * Main body material Polycarbonate + glass fiber
- * Rotating shaft material Metal (SUS)
- * Oil type Silicone oil

Note 1) Rated torque measured at a rotation speed of 20rpm at 23°C

Note 2) Torque can be customized by changing the oil viscosity
(see Cutomizable Torque Chart on page 178)

Note 3) Dampers with gear can also be custom ordered.

● An FRT type damper generates torque in both directions and an FRN type generates one-way torque in the CW direction (R) or CCW direction (L) when the rotating axle is viewed from the top.

Damper Characteristics

1. Speed characteristics

A rotary damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. In addition, please note that the starting torque slightly differs from the rated torque.

2. Temperature characteristics

A rotary damper's torque varies according to the ambient temperature. In addition, as shown in the graph to the right, the torque decreases as the ambient temperature increases, and the torque increases as the ambient temperature decreases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. When the temperature returns to normal, the torque will return to normal as well.

Rotary Damper

FRN-P2 Series(Adjustable Types: Variable Torque Models)

- * Max. rotation speed 50rpm
- * Max. cycle rate 10cycle/min
- * Operating temperature 0~50°C
- * Weight 64g
- * Body and cap material PBT
- * Rotating shaft material SUS
- * Gear, adjustment knob POM
- * Oil type Silicone oil

Specifications

Model	Rated torque	Damping direction
FRN-P2-R501G*	0.05±0.01 N·m (0.5±0.1 kgf·cm)	Clockwise direction
FRN-P2-L501G*		Counter-clockwise direction
FRN-P2-R102G*	0.10±0.02 N·m (1.0±0.2 kgf·cm)	Clockwise direction
FRN-P2-L102G*		Counter-clockwise direction
FRN-P2-R202G*	0.20±0.04 N·m (2.0±0.4 kgf·cm)	Clockwise direction
FRN-P2-L202G*		Counter-clockwise direction

Note 1) Rated torque is measured at a rotation speed of 20rpm at 23°C (adjustment knob set at MAX)

● There are dampers that generate torque in the CW direction or CCW direction when the rotating axle is viewed from the top.

Gear Specifications

Model	G1	*G2
Type	Standard spur gear	Shifted spur gear
Tooth profile	Involute	
Module	1.5	3.0
Pressure angle	20°	
Number of teeth	28	13
Pitch circle diameter	φ42	φ39
Addendum modification coefficient	—	+0.25

Dimensions of G2 gear are in []

How to Adjust Torque

Range of Torque Adjustment

Turn the adjustment knob clockwise to increase damper torque and counterclockwise to decrease it.

●Products specification might be changed without notice.

Characteristics

1. Speed characteristics

A rotary damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. In addition, please note that the starting torque slightly differs from the rated torque.

2. Temperature characteristics

A rotary damper's torque varies according to the ambient temperature. In addition, as shown in the graph to the right, the torque decreases as the ambient temperature increases, and the torque increases as the ambient temperature decreases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. When the temperature returns to normal, the torque will return to normal as well.

Example of Using a Damper

Option Rack

G1 Rack : ROP-020P2-1

Applicable Models	Model
FRN-P2	ROP-020P2-1

Rack specifications : m=1.5
Pressure angle 20° (full depth tooth)
Z=85

There is no provision for option racks complying with the gear specification G2 (shifted spur gear) of FRN-P2

FDT-47A-163	$1.6\pm 0.3 \text{ N}\cdot\text{m}$ ($16\pm 3 \text{ kgf}\cdot\text{cm}$)	Both directions
FDT-47A-203	$2\pm 0.3 \text{ N}\cdot\text{m}$ ($20\pm 3 \text{ kgf}\cdot\text{cm}$)	Both directions
FDN-47A-R502	$0.5\pm 0.15 \text{ N}\cdot\text{m}$ ($5\pm 1.5 \text{ kgf}\cdot\text{cm}$)	Clockwise direction
FDN-47A-L502		Counter-clockwise direction
FDN-47A-R103	$1\pm 0.2 \text{ N}\cdot\text{m}$ ($10\pm 2 \text{ kgf}\cdot\text{cm}$)	Clockwise direction
FDN-47A-L103		Counter-clockwise direction
FDN-47A-R163	$1.6\pm 0.3 \text{ N}\cdot\text{m}$ ($16\pm 3 \text{ kgf}\cdot\text{cm}$)	Clockwise direction
FDN-47A-L163		Counter-clockwise direction
FDN-47A-R203	$2\pm 0.3 \text{ N}\cdot\text{m}$ ($20\pm 3 \text{ kgf}\cdot\text{cm}$)	Clockwise direction
FDN-47A-L203		Counter-clockwise direction

(Note) Rated torque is measured at a rotation speed of 20rpm at $23^{\circ}\text{C}\pm 3^{\circ}\text{C}$

<FDT-47A-※※※>

<FDN-47A-R/L※※※>

How to Use the Damper

- Dampers may generate torque in both directions, clockwise, or counter-clockwise.
- Please make sure that a shaft attached to a damper has a bearing, as the damper itself is not fitted with one.
- Please refer to the recommended dimensions below when creating a shaft for FDN-47A. Not using the recommended shaft dimensions may cause the shaft to slip out.
- To insert a shaft into FDN-47A, insert the shaft while spinning it in the idling direction of the one-way clutch. (Do not force the shaft in from the regular direction. This may damage the oneway clutch.)
- When using FDT-47A, please ensure that a shaft with specified angular dimensions is inserted in the damper's shaft opening. A wobbling shaft and damper shaft may not allow the lid to slow down properly when closing. Please see the diagrams to the right for the recommended shaft dimensions for a damper.
- Please contact us when a continuous rotation is planned.

Damper Characteristics

1. Speed characteristics

A disk damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. Torque at 20rpm is shown in this catalogue. In a closing lid, the rotation speed is slow when the lid begins to close, resulting in the generation of torque that is smaller than the rated torque.

2. Temperature characteristics

Damper torque (rated torque in this catalogue) varies according to the ambient temperature. As the temperature increases, the torque decreases, and as the temperature decreases, the torque increases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. The graph to the right illustrates the temperature characteristics.

Disk Damper

FDT-57A/FDN-57A Series

Fixed Type

Bi-Directional
Adjustable type

Uni-Directional
Self-adjusting

RoHS Compliant

●Products specification might be changed without notice.

- * Max. rotation speed 50rpm
- * Max. cycle rate 12cycle /min
- * Operating temperature $-10\sim 50^{\circ}\text{C}$
- * Weight FDT-57A : 75g
FDN-57A : 94g
- * Main body material Iron (SPFC)
- * Rotating (shaft) material Nylon (with glass)
- * Oil type Silicone oil

Specifications

Model	Rated torque	Damping direction
FDT-57A-303	$3\pm 0.4\text{ N}\cdot\text{m}$ ($30\pm 4\text{ kgf}\cdot\text{cm}$)	Both directions
FDT-57A-403	$4\pm 0.5\text{ N}\cdot\text{m}$ ($40\pm 5\text{ kgf}\cdot\text{cm}$)	Both directions
FDT-57A-503	$4.7\pm 0.5\text{ N}\cdot\text{m}$ ($47\pm 5\text{ kgf}\cdot\text{cm}$)	Both directions
FDN-57A-R303	$3\pm 0.4\text{ N}\cdot\text{m}$ ($30\pm 4\text{ kgf}\cdot\text{cm}$)	Clockwise direction
FDN-57A-L303		Counter-clockwise direction
FDN-57A-R403	$4\pm 0.5\text{ N}\cdot\text{m}$ ($40\pm 5\text{ kgf}\cdot\text{cm}$)	Clockwise direction
FDN-57A-L403		Counter-clockwise direction
FDN-57A-R553	$5.5\pm 0.6\text{ N}\cdot\text{m}$ ($55\pm 6\text{ kgf}\cdot\text{cm}$)	Clockwise direction
FDN-57A-L553		Counter-clockwise direction

Note) Rated torque is measured at a rotation speed of 20rpm at $23^{\circ}\text{C}\pm 3^{\circ}\text{C}$

<FDT-57A-***>

<FDN-57A-R/L***>

How to Use the Damper

- Dampers may generate torque in both directions, clockwise, or counter-clockwise.
- Please make sure that a shaft attached to a damper has a bearing, as the damper itself is not fitted with one.
- Please refer to the recommended dimensions below when creating a shaft for FDN-57A. Not using the recommended shaft dimensions may cause the shaft to slip out.

Shaft's external dimensions	$\phi 10_{-0.03}^{+0.05}$
Surface hardness	HRC55 or higher
Quenching depth	0.5mm or higher
Surface roughness	1.0Z or lower
Chamfer end (Damper insertion side)	$C0.2\sim C0.3$ (or $R0.2\sim R0.3$)

- To insert a shaft into FDN-57A, insert the shaft while spinning it in the idling direction of the one-way clutch. (Do not force the shaft in from the regular direction. This may damage the oneway clutch.)
- When using FDT-57A, please ensure that a shaft with specified angular dimensions is inserted in the damper's shaft opening. A wobbling shaft and damper shaft may not allow the lid to slow down properly when closing. Please see the diagrams to the right for the recommended shaft dimensions for a damper.
- Please contact us when a continuous rotation is planned.

Damper Characteristics

①1. Speed characteristics

A disk damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. Torque at 20rpm is shown in this catalogue. In a closing lid, the rotation speed is slow when the lid begins to close, resulting in the generation of torque that is smaller than the rated torque.

2. Temperature characteristics

Damper torque (rated torque in this catalogue) varies according to the ambient temperature. As the temperature increases, the torque decreases, and as the temperature decreases, the torque increases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. The graph to the right illustrates the temperature characteristics

Damper Characteristics

1. Speed characteristics

A disk damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. Torque at 20rpm is shown in this catalogue. In a closing lid, the rotation speed is slow when the lid begins to close, resulting in the generation of torque that is smaller than the rated torque.

2. Temperature characteristics

Damper torque (rated torque in this catalogue) varies according to the ambient temperature. As the temperature increases, the torque decreases, and as the temperature decreases, the torque increases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. The graph to the right illustrates the temperature characteristics

●Products specification might be changed without notice.

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing.

<Recommended dimensions for a rotating shaft opening>

5. The standard for a damper's working angle is 180° with respect to the main body's attachment flange. Rotating the damper beyond this angle will cause damage to the damper. Please make sure that an external stopper is in place.

<FYN-M1-R>

4. The time it takes for a lid with a damper to close varies according to the ambient temperature. As the temperature increases, it takes less time, and as the temperature decreases, it will take longer for the lid to close. This is because the viscosity of the oil inside the damper changes according to the temperature. When the temperature returns to normal, the required time will return to normal as well. The temperature characteristics are shown in the graph below.

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-P1 Series

Specifications

Model	Max. torque	Reverse torque	Damping direction
FYN-P1-R103	1 N·m	0.3 N·m or lower	Clockwise
FYN-P1-L103	(10 kgf·cm)	(3 kgf·cm or lower)	Counter-clockwise
FYN-P1-R153	1.5 N·m	0.5 N·m or lower	Clockwise
FYN-P1-L153	(15 kgf·cm)	(5 kgf·cm or lower)	Counter-clockwise
FYN-P1-R183	1.8 N·m	0.8 N·m or lower	Clockwise
FYN-P1-L183	(18 kgf·cm)	(8 kgf·cm or lower)	Counter-clockwise

Note) Measured at 23°C±2°C

- * Max. angle 115°
- * Operating temperature -5~50°C
- * Weight 10.5±1g
- * Body and cap material Polybutylene terephthalate (PBT)
- * Rotating shaft material Polybutylene terephthalate (PBT)
- * Oil type Silicone oil

How to Use the Damper

1. FYN-P1 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly.

The damper torque becomes larger, preventing the lid from slowing down.

The damper torque becomes larger, preventing the lid from closing completely.

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque.

Example)

Lid mass M: 1kg

Lid dimensions L: 0.3m

Gravity Center Position : Assumed as $\frac{L}{2}$

Load torque : $T=1 \times 9.8 \times 0.3 \div 2$

$=1.47\text{N}\cdot\text{m}$

Based on the above calculation,

FYN-P1-*153 is selected.

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

●Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The time it takes for the lid to close is shown in the graph to the right.

5. The damper's working angle is 115° , as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-N2 Series

Specifications

Model	Max. torque	Reverse torque	Directions
FYN-N2-R103	1 N·m (10kgf·cm)	0.2 N·m or lower (2 kgf·cm or lower)	Clockwise (CW)
FYN-N2-L103			Counterclockwise (CCW)
FYN-N2-R203	2 N·m (20 kgf·cm)	0.4 N·m or lower (4 kgf·cm or lower)	Clockwise (CW)
FYN-N2-L203			Counterclockwise (CCW)
FYN-N2-R303	3 N·m (30 kgf·cm)	0.8 N·m or lower (8 kgf·cm or lower)	Clockwise (CW)
FYN-N2-L303			Counterclockwise (CCW)

Note) Measured at 23°C±2°C

- * Max. angle 110°
- * Operating temperature -5~50°C
- * Weight 13±1g
- * Body and cap material Polybutylene terephthalate (PBT)

- * Rotating shaft material Polyamide (PA)
- * Oil type Silicone oil

How to Use the Damper

- 1.FYN-N2 series has been designed so that when a lid is closing from a vertical position, as shown in Figure A, high torque is generated just before it closes completely. For a lid that closes from a horizontal position, as shown in Figure B, the strong torque generated just prior to a complete closure may prevent the lid from becoming fully closed.

Stronger damper torque allows the lid to close gently until it is fully closed.

Stronger damper torque prevents the lid from being fully closed.

- 2.When using a damper with a lid shown in the diagram, determine the damper torque based on the following selection calculation.

Example)

Lid weight M: 1.5 kg

Lid dimension L: 0.4 m

Gravity Center Position G: Assumed as $\frac{L}{2}$

Load torque: $T = 1.5 \times 9.8 \times 0.4 \div 2$
 $= 2.94 \text{ N} \cdot \text{m}$

Based on the above calculation, select FYN-N2-*303.

- 3.When connecting parts that are joined to the rotating shaft, ensure a snug fit. The lid will not decelerate as designed when closing if these parts are not connected properly. The dimensional tolerance for fixing the rotating shaft and body case is shown below.

(Recommended dimensions for mounting the rotating shaft)

(Recommended dimensions for mounting the body case)

Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, damper characteristics weaken as the temperature goes up, and become stronger as the temperature goes down. This occurs because the viscosity of oil inside the damper is affected by the temperature change. Once the temperature returns to normal, so will the damper characteristics. Please refer to the right diagram for change in the action time for a free-closing lid.

5. The damper action angle is 110° as shown below. Rotating it beyond this angle will cause the damper to break. Ensure that an external stopper is in place. The action angle is based on the width across flats of the case on the back of the body. The rotation end point is at 90° on the basis of the width across flats of the case. (Refer to the figure below.)

6. There are dampers that generate torque in either the clockwise or counterclockwise direction when the rotating shaft is seen from the above. Select a model according to use.

Vane Damper

FYN-B1 Series

Specifications

Model	Max. torque	Reverse torque	Damping direction
FYN-B1-R502	0.5N·m (5kgf·cm)	0.3N·m or lower (3kgf·cm) or lower	Clockwise
FYN-B1-L502			Counter-clockwise
FYN-B1-R103	1N·m (10kgf·cm)	0.4N·m or lower (4kgf·cm) or lower	Clockwise
FYN-B1-L103			Counter-clockwise
FYN-B1-R153	1.5N·m (15kgf·cm)	0.5N·m or lower (5kgf·cm) or lower	Clockwise
FYN-B1-L153			Counter-clockwise

Note) Measured at 23°C±2°C

- *Max. angle 110°
- *Operating temperature -5~50°C
- *Weight 9±1g
- *Body and cap material Polybutylene terephthalate (PBT)

- *Rotating shaft material Polyphenylene Sulphide (PPS)
- *Oil type Silicone oil
- *R type has Black shaft / L type has white shaft

How to Use the Damper

1. FYN-B1 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly.

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque.

Example)

Lid mass M : 1kg

Lid dimensions L: 0.3m

Gravity Center Position : Assumed as $\frac{L}{2}$

Load torque : $T = 1.5 \times 0.4 \times 9.8 \div 2$
 $= 2.94 \text{ N} \cdot \text{m}$

Based on the above calculation,

FYN-B1-*153 is selected.

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

●Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The changes in the time it takes for the lid to close are shown in the graph to the right.

5. The damper's working angle is 110°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-U1 Series

Specifications

Model	Max. torque	Reverse torque	Damping direction
FYN-U1-R103	1 N·m (10 kgf·cm)	0.5 N·m or lower (5 kgf·cm or lower)	Clockwise
FYN-U1-L103			Counter-clockwise
FYN-U1-R203	2 N·m (20 kgf·cm)	0.7 N·m or lower (7 kgf·cm or lower)	Clockwise
FYN-U1-L203			Counter-clockwise
FYN-U1-R303	3 N·m (30 kgf·cm)	0.9 N·m以下 (9 kgf·cm or lower)	Clockwise
FYN-U1-L303			Counter-clockwise

Note) Measured at 23°C±2°C

- * Max. angle 115°
- * Operating temperature -5~50°C
- * Weight 40±4g
- * Main body, rotating shaft materials Zinc die-cast (ZDC)

- * Cap material Polyphenylene Sulphide (PPS)
- * Oil type Silicone oil

How to Use the Damper

1. FYN-U1 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly.

The damper torque becomes larger, preventing the lid from slowing down.

The damper torque becomes larger, preventing the lid from closing completely.

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque.

Example)

Lid mass M : 1.5kg

Lid dimensions L : 0.4m

Gravity Center Position : Assumed as $\frac{L}{2}$

Load torque : $T = 1.5 \times 9.8 \times 0.4 \div 2$
 $= 2.94 \text{ N} \cdot \text{m}$

Based on the above calculation,
 FYN-U1-303 is selected.

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

●Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The changes in the time it takes for the lid to close are shown in the graph to the right.

5. The damper's working angle is 110°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-C1 Series

Specifications

Model	Max. torque	Reverse torque	Directions
FYN-C1-R203	2N·m (20kgf·cm)	0.3 N·m or lower (3 kgf·cm or lower)	Clockwise (CW)
FYN-C1-L203			Counterclockwise (CCW)

FYN-C1-L403			Counterclockwise (CCW)

Note) Measured at 23°C±2°C

- * Max. angle 110°
- * Operating temperature -5~50°C
- * Weight 30±2g
- * Body and cap material Polybutylene terephthalate (PBT)
- * Rotating shaft material Zinc die-cast (ZDC)
- * Oil type Silicone oil

How to Use the Damper

- The FYN-C1 series has been designed so that when a lid is closing from a vertical position, as shown in Figure A, high torque is generated just before it closes completely. For a lid that closes from a horizontal position, as shown in Figure B, the strong torque generated just prior to a complete closure may prevent the lid from becoming fully closed.

Stronger damper torque allows the lid to close gently until it is fully closed.

Stronger damper torque prevents the lid from being fully closed.

- When using a damper with a lid shown in the diagram, determine the damper torque based on the following selection calculation.

Example)

Lid weight M : 2kg

Lid dimension L : 0.4m

Gravity Center Position G: Assumed as $\frac{L}{2}$

Load torque : $T = 2 \times 9.8 \times 0.4 \div 2$
 $= 3.92 \text{ N} \cdot \text{m}$

Based on the above calculation, select FYN-C1-*403.

- When connecting parts that are joined to the rotating shaft, ensure a snug fit. The lid will not decelerate as designed when closing if these parts are not connected properly. The dimensional tolerance for fixing the rotating shaft and body case is shown below.

●Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, damper characteristics weaken as the temperature goes up, and become stronger as the temperature goes down. This occurs because the viscosity of oil inside the damper is affected by the temperature change. Once the temperature returns to normal, so will the damper characteristics. Please refer to the right diagram for change in the action time for a free-closing lid.

5. The damper action angle is 110° as shown below. Rotating it beyond this angle will cause the damper to break. Ensure that an external stopper is in place. The action angle is based on the width across flats of the case on the back of the body. The rotation end point is at 90° on the basis of the width across flats of the case. (Refer to the figure below.)

6. There are dampers that generate torque in either the clockwise or counterclockwise direction when the rotating shaft is seen from the above. Select a model according to use.

Vane Damper

FYN-D3 Series

Specifications

Model	Max. torque	Reverse torque	Damping direction
FYN-D3-R503	5 N·m	1 N·m or lower	Clockwise
FYN-D3-L503	(50 kgf·cm)	(10 kgf·cm or lower)	Counter-clockwise
FYN-D3-R703	7 N·m	1 N·m or lower	Clockwise

How to Use the Damper

1. FYN-D3 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly.

Diagram A

he damper torque becomes larger, preventing the lid from slowing down.

Diagram B

The damper torque becomes larger, preventing the lid from closing completely.

The angle in which the damper torque becomes large can be customized by modifying the inside orifice.

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque.

Example)

Lid mass M : 5kg

Lid dimensions L : 0.4m

Gravity Center Position : Assumed as $\frac{L}{2}$

Load torque : $T = 5 \times 9.8 \times 0.4 \div 2$

$= 9.8 \text{ N} \cdot \text{m}$

Based on the above calculation,

FYN-D3-*104 is selected.

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

<Recommended dimensions
for mounting a rotating shaft>

●Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The changes in the time it takes for the lid to close are shown in the graph to the right.

5. The damper's working angle is 110° , as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYT/FYN-D1(D2) Series

Specifications

Model	Max. torque	Reverse torque	Damping direction
FYT-D1 (2) -104	10 N·m (100 kgf·cm)	—	Both directions
FYN-D1 (2) -R104	10 N·m (100 kgf·cm)	0.5 N·m or lower (5 kgf·cm or lower)	Clockwise
FYN-D1 (2) -L104			Counter-clockwise

Note) Measured at 23°C±2°C

The FYT/N-D2 series has a shorter shaft length.

- * Max. angle 105°
- * Operating temperature -5~50°C
- * Weight D1 : 215±10g, D2 : 210±10g
- * Body and cap material Zinc die-cast (ZDC)

- * Rotating shaft material S25C
- * Oil type Silicone oil

Dimensions of D2 series are in []

How to Use the Damper

1. The uni-directional FYN-D1 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly. Torque is generated in both clockwise and counterclockwise directions in the FYT-D1 series. Unlike the FYN-D1 series, it does not have a fixed orifice for adjusting torque. Therefore, torque remains constant at any angle.

Diagram A

The damper torque becomes larger, preventing the lid from slowing down.

Diagram B

The damper torque becomes larger, preventing the lid from closing completely.

The angle in which the damper torque becomes large can be customized by modifying the inside orifice.

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque. Example)

Lid mass M : 5kg

Lid dimensions L : 0.4m

Gravity Center Position : Assumed as $\frac{L}{2}$

Load torque : $T = 5 \times 9.8 \times 0.4 \div 2$
 $= 9.8 \text{ N} \cdot \text{m}$

Based on the above calculation,
FYN-D1-*104 is selected.

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

<Recommended dimensions
for mounting a rotating shaft>

●Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The changes in the time it takes for the lid to close are shown in the graph to the right.

5. The damper's working angle is 110°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

6. The FYN-D1 series is a fixed type; its torque is non-adjustable. However, a customized order for a torque between the range of 2 ~20N·m is possible by changing the oil viscosity.

7. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYT/FYN-H1(H2) Series

Specifications

Model	Max. torque	Reverse torque	Damping direction
FYT-H1 (2)-104	10 N·m (100 kgf·cm)	—	Both directions
FYN-H1 (2)-R104	10 N·m (100 kgf·cm)	0.5 N·m or lower (5 kgf·cm or lower)	Clockwise
FYN-H1 (2)-L104	10 N·m (100 kgf·cm)	0.5 N·m or lower (5 kgf·cm or lower)	Counter-clockwise

Note) Measured at 23°C ± 2°C

The FYT/N-H2 series has shorter shaft length.

- * Max. angle 105°
- * Operating temperature -5~50°C
- * Weight H1 : 240±10g, H2 : 235±10g

- * Body and cap material Zinc die-cast (ZDC)
- * Rotating shaft material S25C
- * Oil type Silicone oil

Optional Parts

Rotating shaft flange ROP-010H1

Model
ROP-010H1

Dimensions of H2 series are in []

How to Use the Damper

- The uni-directional FYN-H1 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly. Torque is generated in both clockwise and counterclockwise directions in the FYT-H1 series. Unlike the FYN-H1 series, it does not have a fixed orifice for adjusting torque. Therefore, torque remains constant at any angle.

The damper torque becomes larger, preventing the lid from slowing down.

The damper torque becomes larger, preventing the lid from closing completely.

The angle in which the damper torque becomes large can be customized by modifying the inside orifice.

- When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque. Example)

Lid mass M : 5kg

Lid dimensions L : 0.4m

Gravity Center Position : Assumed as $\frac{L}{2}$

Load torque : $T = 5 \times 9.8 \times 0.4 \div 2$
 $= 9.8 \text{ N·m}$

Based on the above calculation,
 FYN-H1*104 is selected.

- When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

●Products specification might be changed without notice.

4. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The changes in the time it takes for the lid to close are shown in the graph to the right.

5. The damper's working angle is 110°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

6. How to adjust the damper

- 1) In the FYT-H1 (H2) and FYN-H1 (H2) series, the amount of generated torque can be adjusted with the adjustment knob located towards the rear of the main body. Insert a screwdriver in the minus groove to turn.
- 2) Turn the adjustment knob in the H direction to increase torque.
- 3) Turn the adjustment knob in the L direction to reduce torque.
- 4) Do not turn the adjustment knob more than 360°. Turning the knob more than 360° causes the adjustment shaft to slip out, resulting in oil leakage.
- 5) Once the adjustment is complete, secure with a lock screw. Using the damper without securing it may result in fluctuating torque.

<Range of torque adjustment>

Please refer to the graph below for the relationship between torque and the adjustment knob.

7. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-S1 Series

Specifications

Model	Max. torque	Reverse torque	Damping direction
FYN-S1-R104	10 N·m (100 kgf·cm)	1.5 N·m or lower (15 kgf·cm or lower)	Clockwise
FYN-S1-L104			Counter-clockwise

Note) Measured at 23° C ± 2° C

- * Max. angle 130°
- * Operating temperature -5~50°C
- * Weight 220±10g
- * Main body material Zinc die-cast (ZDC)
- * Cap material Zinc die-cast (ZDC)
- * Rotor material Polyacetal (POM)
- * Oil type Silicone oil

How to Use the Damper

1. Operating characteristics of self-adjusting oil pressure dampers

In a conventional vane damper, the damping strength (damping constant) does not change regardless of the load torque used. Because of this, its working speed is slower when the load torque is small, and faster when the load torque is large. However, because the self-adjusting FYN-S1 series is designed to self-adjust the damping force (damping constant) according to the applied load, the working speed fluctuates less compared to conventional dampers when the applied load is altered. The acceptable range of torque is 5 ~ 10N·m. Please select your damper by referring to the motion-time graph below.

[Operating principles of the self-adjusting type]

As shown in the diagram to the left, by changing the shape of the valve (flat spring), the amount of oil flow is altered, adjusting the damper's generated torque. (PAT.P)

[Measurement conditions for the motion-time graph]

- Load torque T 5~10N·m
- Measured angle 30° ~ -30°
- Measurement temperature 23° C ± 2° C

[Motion time graph]

As the level of self-adjustment may vary depending on the range of the working angle of the actual work, please verify under actual working conditions before you select your damper.

●Products specification might be changed without notice.

2. When using the damper, please ensure that a shaft with specified angular dimensions is inserted in the damper's shaft opening. Also, please ensure a tight fit between the shaft and the damper shaft's opening. Without a tight fit, the non-damping range becomes larger in a closing motion, etc., and it may not slow down properly. Please see the diagrams to the right for the recommended shaft dimensions for a damper.

3. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The time it takes for the lid to close is shown in the graph to the right.

4. The damper's working angle is 130°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place.

5. Because the FYN-S1 series is a self-adjusting type, the torque cannot be adjusted manually. However, by altering the viscosity of the oil, its damper characteristics can be modified. (Please contact us, as this is a custom order.)

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-X2 Series

Specifications

Model	Max. torque	Reverse torque	Directions
FYN-X2-R154	15N·m (150kgf·cm)	2 N·m or lower (20kgf·cm以下)	Clockwise
FYN-X2-L154			Counterclockwise
FYN-X2-R254	25N·m (250kgf·cm)	3 N·m or lower (30 kgf·cm or lower)	Clockwise
FYN-X2-L254			Counterclockwise

Note) Measured at 23°C±2°C

- *Max. angle 106°
- *Operating temperature -5~50°C
- *Weight 287±10g
- *Body material Zinc die-cast (ZDC)
- *Cap material Zinc die-cast (ZDC)
- *Rotor material Zinc die-cast (ZDC)
- *Oil type Silicone oil

How to Use the Damper

1. Operating characteristics of self-adjusting oscillating dampers

In a conventional oscillating damper, the damping strength (damping constant) does not change regardless of the load torque used. Therefore, the operating speed is slower when the load torque is small, and faster when the load torque is large.

However, since the self-adjusting FYN-X2 series is designed to self-adjust the damping strength (damping constant) according to the applied load, its motion-time fluctuates less than that of conventional dampers when the load changes.

The acceptable range of torque is 10 to 15N·m or 20 to 25N·m. Please select your damper by referring to the motion-time graph below.

[Operating principles of the self-adjusting type]

As shown in the diagram to the left, by changing the shape of the valve (flat spring), the amount of oil flow is altered, adjusting the damper's generated torque. (PAT.P)

[Measurement conditions for the motion-time graph]

[Motion time graph]

FYN-X2 25N·m specification

- Measuring temperature : Room temperature (23±3°C)
- Load torque : 20~25N·m
- Measuring angle : +30°~-30°

FYN-X2 15N·m specification

- Measuring temperature : Room temperature (23±3°C)
- Load torque : 10~15N·m
- Measuring angle : +30°~-30°

As the level of self-adjustment may vary depending on the range of the working angle of the actual work, please verify under actual working conditions before you select your damper.

●Products specification might be changed without notice.

2. When using the damper, please ensure that a shaft with specified angular dimensions is inserted in the damper's shaft opening. Also, please ensure a tight fit between the shaft and the damper shaft's opening. Without a tight fit, the play becomes larger in a closing motion, etc., and the lid may not slow down properly. Please see the diagrams to the right for the recommended shaft dimensions for a damper.

Recommended shaft dimensions

3. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The time it takes for the lid to close is shown in the graph to the right.

4. The damper's working angle is 106° as shown below. Rotating the damper beyond this angle will cause the damage to the damper. Please ensure that an external stopper is in place.

5. Because the FYN-X2 series is a self-adjusting type, the torque cannot be adjusted manually. However, by altering the viscosity of the oil, its damper characteristics can be modified.

* Please contact us, as this is a custom order,

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-Z2 Series

Specifications

Model	Max. torque	Reverse torque	Directions
FYN-Z2-R354	35N·m (350kgf·cm)	3 N·m or lower (30 kgf·cm or lower)	Clockwise
FYN-Z2-L354			Counterclockwise

Note) Measured at 23°C±2°C

- *Max. angle 94°
- *Operating temperature -5~50°C
- *Weight 506±10g
- *Body material Zinc die-cast (ZDC)
- *Cap material Iron (SPFC)
- *Rotor material Zinc die-cast (ZDC)
- *Oil type Silicone oil

How to Use the Damper

1. Operating characteristics of self-adjusting oscillating dampers

In a conventional oscillating damper, the damping strength (damping constant) does not change regardless of the load torque used. Therefore, the operating speed is slower when the load torque is small, and faster when the load torque is large.

However, since the self-adjusting FYN-X2 series is designed to self-adjust the damping strength (damping constant) according to the applied load, its motion-time fluctuates less than that of conventional dampers when the load changes.

The acceptable range of torque is 20 to 35 N·m. Please select your damper by referring to the motion-time graph below.

[Operating principles of the self-adjusting type]

As shown in the diagram to the left, the spring compressed by the movement of the cylindrical valve alters the amount of oil flow so as to adjust the generated torque of the damper. (Patent pending)

[Measurement conditions for the motion-time graph]

- Measuring temperature : Room temperature (23±3°C)
- Load torque : 20~35N·m
- Measuring angle: +30°~-30°

[Motion time graph]

As the level of self-adjustment may vary depending on the range of the working angle of the actual work, please verify under actual working conditions before you select your damper.

●Products specification might be changed without notice.

2. When using the damper, please ensure that a shaft with specified angular dimensions is inserted in the damper's shaft opening. Also, please ensure a tight fit between the shaft and the damper shaft's opening. Without a tight fit, the play becomes larger in a closing motion, etc., and the lid may not slow down properly. Please see the diagrams to the right for the recommended shaft dimensions for a damper.

3. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The time it takes for the lid to close is shown in the graph to the right.

4. The damper's working angle is 94° as shown below. Rotating the damper beyond this angle will cause the damage to the damper. Please ensure that an external stopper is in place.

5. Because the FYN-Z2 series is a self-adjusting type, the torque cannot be adjusted manually. However, by altering the viscosity of the oil, its damper characteristics can be modified.

* Please contact us, as this is a custom order,

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Vane Damper

FYN-A2 Series

Specifications

Model	Max. torque	Reverse torque	Directions
FYN-A2-R204	20N·m (200kgf·cm)	2N·m or lower (20kgf·cm lower)	Clockwise
FYN-A2-L204			Counterclockwise

- * Max. angles 120°
- * Operating temperature -5 ~ 50° C
- * Weight 222 ± 11g
- * Body material Zinc die - cast (ZDC)
- * Cap material Zinc die - cast (ZDC)
- * Rotor material Zinc die - cast (ZDC)
- * Oil type Silicone oil
- * Rotary color L: Black R: White

How to Use the Damper

1. Operating characteristics of self-adjusting oscillating dampers

in a conventional oscillating damper, the damping strength (damping constant) does not change regardless of the load torque used.

Therefore, the operating speed is slower when the load torque is small, and faster when the load torque is large.

However, since the self-adjusting FYN-A2 series is designed to self-adjustable the damping strength (damping constant) according to the applied load, its motion-time fluctuates less than that of conventional dampers when the load changes.

The acceptable range of torque is 10 to 15N·m or 20 to 25N·m. Please select your damper by referring to the motion graph below.

[Operating principles of the self-adjusting type]

As shown in the diagram to the left, by changing the shape of the valve (flat spring), the amount of oil flow is altered, adjusting the damper's generated torque. (PAT.P)

[Measurement conditions for the motion-time graph]

- Measuring temperature : Room temperature (23±3°C)
- Load torque : 10~20N·m
- Measuring angle : +30° ~ -30°

[Motion time graph]

As the level of self-adjustment may vary depending on the range of the working angle of the actual work, please verify under actual working conditions before you select your damper.

●Products specification might be changed without notice.

2. When using the damper, please ensure that a shaft with specified angular dimensions is inserted in the damper's shaft opening. Also, please ensure a tight fit between the shaft and the damper shaft's opening. Without a tight fit, the play becomes larger in a closing motion, etc., and the lid may not slow down properly. Please see the diagrams to the right for the recommended shaft dimensions for a damper.

3. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature decreases. This is because the viscosity of the temperature. When the temperature returns to normal, The damper characteristics will return to normal as well. The time it takes for the lid to close is shown in the graph to the right.

4. The damper's working angle is 120° as shown below. Rotating the damper beyond this angle will cause the damage to the damper. Please ensure that an external stopper is in place.

5. Because the FYN-A2 series is a self-adjusting type, the torque cannot be adjusted manually. However, by altering the viscosity of the oil, its damper characteristics can be modified. (Please contact us, as this is a custom order.) 6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

Precautions for Use

* When using the vane damper, ensure that after having fully opened the lid, move the lid to a point where free fall starts, and then release the hand from the lid. If the lid is slightly opened and in this state the hand is released, the lid may not be able to sufficiently slow down and the lid may be closed with force, which could result in an injury such as getting the hand caught by the lid.

Vane Damper

FYT/FYN-LA3 Series

Specifications

Model	Max. torque	Damping constant	Damping direction
FYT-LA3	40N·m (400kgf·cm)	10~60N·m/(rad/sec)	Both directions
FYN-LA3-R			Clockwise
FYN-LA3-L			Counter-clockwise

Note) Measured at 23°C±2°C

- * Max. angle 210°
- * Operating temperature 0~50°C
- * Weight 1.75k g
- * Body and cap material Zinc die-cast (ZDC)
- * Rotating shaft material Alloy steel
- * Oil type Silicone oil

How to Use the Damper

1. Damper characteristics vary according to the ambient temperature. In general, the damping constant decreases as the temperature increases, and the damping constant increases as the temperature decreases. This is because the viscosity of the oil inside the damper changes according to the temperature. When the temperature returns to normal, the damping constant will return to normal as well.

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque.

Example)

Lid mass M : 20kg

Lid dimensions L : 0.4m

Gravity Center Position : Assumed as $\frac{L}{2}$

Load torque : $T = 20 \times 0.4 \times 9.8 \div 2$
= 39.2N·m

3. FYT, FYN-LA3 series are torque-adjustable types. Turn the damping adjustment screw located on the back of the main body by inserting a slotted screwdriver. The damping constant increases when turned to the + direction (right). The damping constant decreases when turned to the - direction (left).

Torque adjustment screw

Instruction for Damper Attachment

1. When attaching a rotating shaft to its corresponding part, ensure that they are firmly attached together by making the gap between them as small as possible. A large gap may affect the damper's non-damping range, preventing the lid from slowing down properly.
2. The damper's working angle is $\pm 105^\circ$, as shown on the right (second diagram). Please determine where to attach it according to your needs.
3. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.
4. Do not use the damper as a stopper. An external stopper must be attached at the stopping position.
5. In FYN-LA3-L and FYN-LA3-R, the angular velocity in the reverse direction (opposite to the direction of torque generation) should be 1 rad/sec or less.

How to Calculate the Damping Constant for Vane Dampers

1. Delayed absorption in linear motion

$$\text{Formula (N}\cdot\text{m}/(\text{rad}/\text{sec})) = \frac{FL^2t}{d}$$

F = Force or mass applied to the lever tip (N)
L = Distance between the centre of the damper shaft and the lever's point of application (m)
d = Distance travelled by lever (m)
t = Travelling time of the lever (sec)

2. Delayed absorption in rotation

$$\text{Formula (N}\cdot\text{m}/(\text{rad}/\text{sec})) = \frac{T}{\omega}$$

T = Torque applied to shaft (N·m)
 ω = Angular velocity(rad/sec)

3. Impact absorption in linear motion

$$\text{Formula (N}\cdot\text{m}/(\text{rad}/\text{sec})) = \frac{MVL^2}{d}$$

M = Mass(kg)
V = Velocity(m/sec)
L = Distance between the centre of the damper shaft and the lever's point of application (m)
d = Distance travelled by lever (m)

Hinge Damper

FHD-A1 Series

Fixed Type

Bi-Directional

Adjustable type

Uni-Directional

Self-adjusting

RoHS Compliant

●Products specification might be changed without notice.

Specifications

Model	Max. torque	Max. reverse torque
FHD-A1-1-503	5N·m (50 kgf·cm)	0.6N·m or lower (6kgf·cm or lower)
FHD-A1-2-503		
FHD-A1-1-104	10N·m (100 kgf·cm)	1N·m or lower (10kgf·cm or lower)
FHD-A1-2-104		

* Max. angle 120°
 * Operating temperature -5~50°C
 * Weight 410g

* Main body material Zinc die-cast (ZDC)
 + silver coating
 * Hinge material SUS304
 * Oil type Silicone oil

<FHD-A1-1-***>

<FHD-A1-2-***>

How to Use the Damper

1. There are two ways to attach the damper, as shown below.

○Attached externally(FHD-A1-1***)

○Attached internally(FHD-A1-2***)

2. This damper is only for horizontal application. Please do not use this damper for vertical application.

Damper Characteristics

1. Temperature characteristics

Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well.

2. The working angle of the hinge is 120° .

Operating the hinge beyond this angle will cause damage to the hinge. Please ensure that an external stopper is in place.

FHD-B1-133-2-K	
FHD-B2-133-2-K	

Note) Damper torque was measured at 25°C±2°C* at 2rpm

- * Max. rotation speed 15rpm
- * Max. cycle rate 5cycle / min
- * Operating temperature 0°C~60°C
- * Weight FHD-B1/B2-133 :50 g
- FHD-B1/B2-133-1:40 g

How to Use the Damper

1. The damper generates torque in both clockwise and counter-clockwise directions.
2. A friction-type hinge damper can be used as a bearing.
3. Friction-type hinge dampers have a long product life and do not require lubrication.
4. Torque down will result if the damper part gets wet with water or oil.
5. It cannot be used for continuous rotation. Please use it in a vane motion.
6. Depending on the operating conditions, it can be used as a free-stop hinge. Please calculate the retention torque based on the following equation.

$$\text{Retention torque } \alpha = \frac{M \times 9.8 \times \frac{L}{2} \times \cos \theta}{0.65 \times \alpha \times N} \text{ (N·m)}$$

M : Mass of the retaining part

L : Distance between the tip of retaining part and the centre of rotation

θ : Retention angle from the retaining part's horizontal position

α : Temperature coefficient of the max. temperature

N : Number of dampers used

7. This damper is only for horizontal application. Please do not use this damper for vertical application.

Damper Characteristics

1. Temperature characteristics

Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the temperature of the shaft bush inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well.

2. Speed characteristics

The speed characteristics of a friction-type hinge damper are shown in the graph below. The damper torque is determined based on the speed characteristics at 2rpm.

(Measurement temperature : 25°C±2°C)
(Working angle : 90°)

How to Use the Damper

- The damper generates torque in both the clockwise and counter-clockwise directions. (A one-way clutch is built in inside the damper.)
- Please make sure that the shaft attached to a damper has a bearing, as the damper itself is not fitted with one.
- It can be used as a free-stop for a load that is smaller than the rated torque.
- Please refer to the recommended dimensions below when creating a shaft for attachment to the damper. Using a shaft outside of the recommended dimensions may cause the shaft to slip out.
- To insert a shaft into the damper, insert the shaft while spinning it in the opposite direction of the damper's direction of torque generation. (Do not force the shaft in from a regular direction. This may damage the built-in oneway clutch.)

Shaft's external dimensions	6 $\phi_{0.03}$
Surface hardness	HRC55 or higher
Quenching depth	0.5mm or higher
Surface roughness	1.0Z or lower
Chamfer end (Damper insertion side)	 C0.2~C0.3 (or R0.2~R0.3)
